A quantitative analysis of the concentrations of creatine kinase (CK) and aspartate aminotransferase (AST) in serum, urine, and cerebrospinal fluid (CSF) of patients with cancer of the central nervous system (CNS) was performed. The results of the investigation demonstrated that the serum, urine, and CSF levels of CK activity were about twice the normal range; in contrast, AST activities in serum and urine were within normal limits. The results indicate that these changes in CK activity in serum, urine, and CSF are not specific for CNS malignancy and that this finding is most likely due to the extent of the primary disease process. of 10? True Let $r = -2658 - -3874$. Is r a multiple of 9? False Suppose $5*o - 4*h = 25$, $o + 3*h = -o + 1$. Let i be $((-4)/5)/((-10)/175)$. Suppose $-o*q = -i*q + 975$. Is 15 a factor of q ?
